00W8 This chapter contains some elementary material about categories, functors, and natural transformations. Notably, we discuss and explore:

1. Categories ([Section 1](#)).
2. The quadruple adjunction $\pi_0 \dashv (-)_{\text{disc}} \dashv \text{Obj} \dashv (-)_{\text{indisc}}$ between the category of categories and the category of sets ([Section 2](#)).
3. Groupoids, categories in which all morphisms admit inverses ([Section 3](#)).
4. Functors ([Section 4](#)).
5. The conditions one may impose on functors in decreasing order of importance:
 - (a) [Section 5](#) introduces the foundationally important conditions one may impose on functors, such as faithfulness, conservativity, essential surjectivity, etc.
 - (b) [Section 6](#) introduces more conditions one may impose on functors that are still important but less omni-present than those of [Section 5](#), such as being dominant, being a monomorphism, being pseudomonadic, etc.
 - (c) [Section 7](#) introduces some rather rare or uncommon conditions one may impose on functors that are nevertheless still useful to explicitly record in this chapter.
6. Natural transformations ([Section 8](#)).
7. The various categorical and 2-categorical structures formed by categories, functors, and natural transformations ([Section 9](#)).

DEFINITION 1.1.1 ► CATEGORIES

A **category** $(C, \circ^C, \mathbb{1}^C)$ consists of:

- *Objects.* A class $\text{Obj}(C)$ of **objects**.
- *Morphisms.* For each $A, B \in \text{Obj}(C)$, a class $\text{Hom}_C(A, B)$, called the **class of morphisms of C from A to B** .
- *Identities.* For each $A \in \text{Obj}(C)$, a map of sets

$$\mathbb{1}_A^C: \text{pt} \rightarrow \text{Hom}_C(A, A),$$

called the **unit map of C at A** , determining a morphism

$$\text{id}_A: A \rightarrow A$$

of C , called the **identity morphism of A** .

- *Composition.* For each $A, B, C \in \text{Obj}(C)$, a map of sets

$$\circ_{A,B,C}^C: \text{Hom}_C(B, C) \times \text{Hom}_C(A, B) \rightarrow \text{Hom}_C(A, C),$$

called the **composition map of C at (A, B, C)** .

such that the following conditions are satisfied:

1. *Associativity.* The diagram

$$\begin{array}{ccccc}
 & & \text{Hom}_C(C, D) \times (\text{Hom}_C(B, C) \times \text{Hom}_C(A, B)) & & \\
 & \nearrow \alpha_{\text{Hom}_C(C,D), \text{Hom}_C(B,C), \text{Hom}_C(A,B)}^{\text{Sets}} & & \searrow \text{id}_{\text{Hom}_C(C,D)} \times \circ_{A,B,C}^C & \\
 (\text{Hom}_C(C, D) \times \text{Hom}_C(B, C)) \times \text{Hom}_C(A, B) & & & & \text{Hom}_C(C, D) \times \text{Hom}_C(A, C) \\
 \downarrow \circ_{B,C,D}^C \times \text{id}_{\text{Hom}_C(A,B)} & & & & \downarrow \circ_{A,C,D}^C \\
 \text{Hom}_C(B, D) \times \text{Hom}_C(A, B) & \xrightarrow{\circ_{A,B,D}^C} & & & \text{Hom}_C(A, D)
 \end{array}$$

commutes, i.e. for each composable triple (f, g, h) of morphisms of C , we have

$$(f \circ g) \circ h = f \circ (g \circ h).$$

2. *Left Unitality*. The diagram

$$\begin{array}{ccc} \text{pt} \times \text{Hom}_C(A, B) & & \\ \downarrow \mathbb{1}_B^C \times \text{id}_{\text{Hom}_C(A, B)} & \searrow \lambda_{\text{Hom}_C(A, B)}^{\text{Sets}} & \\ \text{Hom}_C(B, B) \times \text{Hom}_C(A, B) & \xrightarrow{\circ_{A, B, B}^C} & \text{Hom}_C(A, B) \end{array}$$

commutes, i.e. for each morphism $f: A \rightarrow B$ of C , we have

$$\text{id}_B \circ f = f.$$

3. *Right Unitality*. The diagram

$$\begin{array}{ccc} \text{Hom}_C(A, B) \times \text{pt} & & \\ \downarrow \text{id}_{\text{Hom}_C(A, B)} \times \mathbb{1}_A^C & \searrow \rho_{\text{Hom}_C(A, B)}^{\text{Sets}} & \\ \text{Hom}_C(A, B) \times \text{Hom}_C(A, A) & \xrightarrow{\circ_{A, A, B}^C} & \text{Hom}_C(A, B) \end{array}$$

commutes, i.e. for each morphism $f: A \rightarrow B$ of C , we have

$$f \circ \text{id}_A = f.$$

NOTATION 1.1.2 ► FURTHER NOTATION FOR MORPHISMS IN CATEGORIES

Let C be a category.

00WD

1. We also write $C(A, B)$ for $\text{Hom}_C(A, B)$.

00WE

2. We write $\text{Mor}(C)$ for the class of all morphisms of C .

00WF

DEFINITION 1.1.3 ► SIZE CONDITIONS ON CATEGORIES

Let κ be a regular cardinal. A category C is

00WG

1. **Locally small** if, for each $A, B \in \text{Obj}(C)$, the class $\text{Hom}_C(A, B)$ is a set.

00WH

2. **Locally essentially small** if, for each $A, B \in \text{Obj}(C)$, the class

$$\text{Hom}_C(A, B) / \{\text{isomorphisms}\}$$

is a set.

00WJ

3. **Small** if C is locally small and $\text{Obj}(C)$ is a set.

00WK

4. κ -**Small** if C is locally small, $\text{Obj}(C)$ is a set, and we have $\#\text{Obj}(C) < \kappa$.

00WL

1.2 Examples of Categories

00WM

EXAMPLE 1.2.1 ► THE PUNCTUAL CATEGORY

The **punctual category**¹ is the category pt where

- *Objects.* We have

$$\text{Obj}(\text{pt}) \stackrel{\text{def}}{=} \{\star\}.$$

- *Morphisms.* The unique Hom-set of pt is defined by

$$\text{Hom}_{\text{pt}}(\star, \star) \stackrel{\text{def}}{=} \{\text{id}_{\star}\}.$$

- *Identities.* The unit map

$$\mathbb{1}_{\star}^{\text{pt}} : \text{pt} \rightarrow \text{Hom}_{\text{pt}}(\star, \star)$$

of pt at \star is defined by

$$\text{id}_{\star}^{\text{pt}} \stackrel{\text{def}}{=} \text{id}_{\star}.$$

- *Composition.* The composition map

$$\circ_{\star, \star, \star}^{\text{pt}} : \text{Hom}_{\text{pt}}(\star, \star) \times \text{Hom}_{\text{pt}}(\star, \star) \rightarrow \text{Hom}_{\text{pt}}(\star, \star)$$

of pt at (\star, \star, \star) is given by the bijection $\text{pt} \times \text{pt} \cong \text{pt}$.

¹Further Terminology: Also called the **singleton category**.

00WN

EXAMPLE 1.2.2 ► MONOIDS AS ONE-OBJECT CATEGORIES

We have an isomorphism of categories¹

$$\text{Mon} \cong \text{pt} \times_{\text{Sets}} \text{Cats},$$

$$\begin{array}{ccc} \text{Mon} & \longrightarrow & \text{Cats} \\ \downarrow \lrcorner & & \downarrow \text{Obj} \\ \text{pt} & \xrightarrow{[\text{pt}]} & \text{Sets} \end{array}$$

via the delooping functor $B: \text{Mon} \rightarrow \text{Cats}$ of ?? of ??, exhibiting monoids as exactly those categories having a single object.

¹This can be enhanced to an isomorphism of 2-categories

$$\text{Mon}_{2\text{disc}} \cong \text{pt}_{\text{bi}} \times_{\text{Sets}_{2\text{disc}}} \text{Cats}_{2,*},$$

$$\begin{array}{ccc} \text{Mon}_{2\text{disc}} & \longrightarrow & \text{Cats}_{2,*} \\ \downarrow \lrcorner & & \downarrow \text{Obj} \\ \text{pt}_{\text{bi}} & \xrightarrow{[\text{pt}]} & \text{Sets}_{2\text{disc}} \end{array}$$

between the discrete 2-category $\text{Mon}_{2\text{disc}}$ on Mon and the 2-category of pointed categories with one object.

PROOF 1.2.3 ► PROOF OF EXAMPLE 1.2.2

Omitted. 

00WP

EXAMPLE 1.2.4 ► THE EMPTY CATEGORY

The **empty category** is the category \emptyset_{cat} where

- *Objects.* We have

$$\text{Obj}(\emptyset_{\text{cat}}) \stackrel{\text{def}}{=} \emptyset.$$

- *Morphisms.* We have

$$\text{Mor}(\emptyset_{\text{cat}}) \stackrel{\text{def}}{=} \emptyset.$$

- *Identities and Composition.* Having no objects, \emptyset_{cat} has no unit nor composition maps.

00WQ

EXAMPLE 1.2.5 ► ORDINAL CATEGORIES

The n th ordinal category is the category \mathfrak{n} where¹

- *Objects.* We have

$$\text{Obj}(\mathfrak{n}) \stackrel{\text{def}}{=} \{[0], \dots, [n]\}.$$

- *Morphisms.* For each $[i], [j] \in \text{Obj}(\mathfrak{n})$, we have

$$\text{Hom}_{\mathfrak{n}}([i], [j]) \stackrel{\text{def}}{=} \begin{cases} \{\text{id}_{[i]}\} & \text{if } [i] = [j], \\ \{[i] \rightarrow [j]\} & \text{if } [j] < [i], \\ \emptyset & \text{if } [j] > [i]. \end{cases}$$

- *Identities.* For each $[i] \in \text{Obj}(\mathfrak{n})$, the unit map

$$\mathbb{1}_{[i]}^{\mathfrak{n}} : \text{pt} \rightarrow \text{Hom}_{\mathfrak{n}}([i], [i])$$

of \mathfrak{n} at $[i]$ is defined by

$$\text{id}_{[i]}^{\mathfrak{n}} \stackrel{\text{def}}{=} \text{id}_{[i]}.$$

- *Composition.* For each $[i], [j], [k] \in \text{Obj}(\mathfrak{n})$, the composition map

$$\circ_{[i],[j],[k]}^{\mathfrak{n}} : \text{Hom}_{\mathfrak{n}}([j], [k]) \times \text{Hom}_{\mathfrak{n}}([i], [j]) \rightarrow \text{Hom}_{\mathfrak{n}}([i], [k])$$

of \mathfrak{n} at $([i], [j], [k])$ is defined by

$$\begin{aligned} \text{id}_{[i]} \circ \text{id}_{[i]} &= \text{id}_{[i]}, \\ ([j] \rightarrow [k]) \circ ([i] \rightarrow [j]) &= ([i] \rightarrow [k]). \end{aligned}$$

¹In other words, \mathfrak{n} is the category associated to the poset

$$[0] \rightarrow [1] \rightarrow \dots \rightarrow [n-1] \rightarrow [n].$$

The category \mathfrak{n} for $n \geq 2$ may also be defined in terms of 0 and joins ($??$, $??$): we have isomorphisms of categories

$$\begin{aligned}
 1 &\cong 0 \star 0, \\
 2 &\cong 1 \star 0 \\
 &\cong (0 \star 0) \star 0, \\
 3 &\cong 2 \star 0 \\
 &\cong (1 \star 0) \star 0 \\
 &\cong ((0 \star 0) \star 0) \star 0, \\
 4 &\cong 3 \star 0 \\
 &\cong (2 \star 0) \star 0 \\
 &\cong ((1 \star 0) \star 0) \star 0 \\
 &\cong (((0 \star 0) \star 0) \star 0) \star 0,
 \end{aligned}$$

and so on.

of X_{pos} at (a, b, c) is defined as either the inclusion $\emptyset \hookrightarrow \text{pt}$ or the identity map of pt , depending on whether we have $a \preceq_X b$, $b \preceq_X c$, and $a \preceq_X c$.

00X5

2. A category C is **posetal**¹ if C is equivalent to X_{pos} for some poset (X, \preceq_X) .

Let \mathcal{C} and \mathcal{D} be categories.

00ZW DEFINITION 4.1.1 ► FUNCTORS

A **functor** $F: \mathcal{C} \rightarrow \mathcal{D}$ **from \mathcal{C} to \mathcal{D}** ¹ consists of:

1. *Action on Objects.* A map of sets

$$F: \text{Obj}(\mathcal{C}) \rightarrow \text{Obj}(\mathcal{D}),$$

called the **action on objects of F** .

2. *Action on Morphisms.* For each $A, B \in \text{Obj}(\mathcal{C})$, a map

$$F_{A,B}: \text{Hom}_{\mathcal{C}}(A, B) \rightarrow \text{Hom}_{\mathcal{D}}(F(A), F(B)),$$

called the **action on morphisms of F at (A, B)** ².

satisfying the following conditions:

1. *Preservation of Identities.* For each $A \in \text{Obj}(C)$, the diagram

NOTATION 4.1.2 ► SUBSCRIPT AND SUPERScript NOTATION FOR FUNCTORS

Let C and \mathcal{D} be categories, and write C^{op} for the opposite category of C of ??, ??.

00ZY

1. Given a functor

$$F: C \rightarrow \mathcal{D},$$

we also write F_A for $F(A)$.

00ZZ

2. Given a functor

$$F: C^{\text{op}} \rightarrow \mathcal{D},$$

we also write F^A for $F(A)$.

0100

3. Given a functor

$$F: C \times C \rightarrow \mathcal{D},$$

we also write $F_{A,B}$ for $F(A, B)$.

0101

4. Given a functor

$$F: C^{\text{op}} \times C \rightarrow \mathcal{D},$$

we also write F_B^A for $F(A, B)$.

We employ a similar notation for morphisms, writing e.g. F_f for $F(f)$ given a functor $F: C \rightarrow \mathcal{D}$.

0102

NOTATION 4.1.3 ► ADDITIONAL NOTATION FOR FUNCTORS

Following the notation $\llbracket x \mapsto f(x) \rrbracket$ for a function $f: X \rightarrow Y$ introduced in [Sets](#), [Notation 1.1.2](#), we will sometimes denote a functor $F: C \rightarrow \mathcal{D}$ by

$$F \stackrel{\text{def}}{=} \llbracket A \mapsto F(A) \rrbracket,$$

specially when the action on morphisms of F is clear from its action on objects.

0103

EXAMPLE 4.1.4 ► IDENTITY FUNCTORS

The **identity functor** of a category C is the functor $\text{id}_C: C \rightarrow C$ where

1. *Action on Objects.* For each $A \in \text{Obj}(C)$, we have

$$\text{id}_C(A) \stackrel{\text{def}}{=} A.$$

2. *Action on Morphisms.* For each $A, B \in \text{Obj}(C)$, the action on morphisms

$$(\text{id}_C)_{A,B}: \text{Hom}_C(A, B) \rightarrow \underbrace{\text{Hom}_C(\text{id}_C(A), \text{id}_C(B))}_{\stackrel{\text{def}}{=} \text{Hom}_C(A, B)}$$

of id_C at (A, B) is defined by

$$(\text{id}_C)_{A,B} \stackrel{\text{def}}{=} \text{id}_{\text{Hom}_C(A, B)}.$$

PROOF 4.1.5 ► PROOF OF EXAMPLE 4.1.4

Preservation of Identities

We have $\text{id}_C(\text{id}_A) \stackrel{\text{def}}{=} \text{id}_A$ for each $A \in \text{Obj}(C)$ by definition.

Preservation of Compositions

For each composable pair $A \xrightarrow{f} B \xrightarrow{g} C$ of morphisms of C , we have

$$\begin{aligned} \text{id}_C(g \circ f) &\stackrel{\text{def}}{=} g \circ f \\ &\stackrel{\text{def}}{=} \text{id}_C(g) \circ \text{id}_C(f). \end{aligned}$$

This finishes the proof. 

0104

DEFINITION 4.1.6 ► COMPOSITION OF FUNCTORS

The **composition** of two functors $F: C \rightarrow D$ and $G: D \rightarrow E$ is the functor $G \circ F$ where

- *Action on Objects.* For each $A \in \text{Obj}(C)$, we have

$$[G \circ F](A) \stackrel{\text{def}}{=} G(F(A)).$$

- *Action on Morphisms.* For each $A, B \in \text{Obj}(C)$, the action on morphisms

$$(G \circ F)_{A,B}: \text{Hom}_C(A, B) \rightarrow \text{Hom}_E(G_{F_A}, G_{F_B})$$

of $G \circ F$ at (A, B) is defined by

$$[G \circ F](f) \stackrel{\text{def}}{=} G(F(f)).$$

PROOF 4.1.7 ► PROOF OF DEFINITION 4.1.6

Preservation of Identities

For each $A \in \text{Obj}(C)$, we have

$$\begin{aligned} G_{F_{\text{id}_A}} &= G_{\text{id}_{F_A}} && \text{(functoriality of } F) \\ &= \text{id}_{G_{F_A}}. && \text{(functoriality of } G) \end{aligned}$$

Preservation of Composition

For each composable pair (g, f) of morphisms of \mathcal{C} , we have

$$\begin{aligned} G_{F_g \circ f} &= G_{F_g \circ F_f} && \text{(functoriality of } F) \\ &= G_{F_g} \circ G_{F_f}. && \text{(functoriality of } G) \end{aligned}$$

This finishes the proof.

PROPOSITION 4.1.8 ► ELEMENTARY PROPERTIES OF FUNCTORS

Let $F: \mathcal{C} \rightarrow \mathcal{D}$ be a functor.

0106

1. *Preservation of Isomorphisms.* If f is an isomorphism in \mathcal{C} , then $F(f)$ is an isomorphism in \mathcal{D} .¹

¹When the converse holds, we call F *conservative*, see [Definition 5.4.1](#).

PROOF 4.1.9 ► PROOF OF PROPOSITION 4.1.8**Item 1: Preservation of Isomorphisms**

Indeed, we have

$$\begin{aligned} F(f)^{-1} \circ F(f) &= F(f^{-1} \circ f) \\ &= F(\text{id}_A) \\ &= \text{id}_{F(A)} \end{aligned}$$

and

$$\begin{aligned} F(f) \circ F(f)^{-1} &= F(f \circ f^{-1}) \\ &= F(\text{id}_B) \\ &= \text{id}_{F(B)}, \end{aligned}$$

showing $F(f)$ to be an isomorphism. 

0107 4.2 Contravariant Functors

Let \mathcal{C} and \mathcal{D} be categories, and let \mathcal{C}^{op} denote the opposite category of \mathcal{C} of ??, ??.

0108 DEFINITION 4.2.1 ► CONTRAVARIANT FUNCTORS

A **contravariant functor** from \mathcal{C} to \mathcal{D} is a functor from \mathcal{C}^{op} to \mathcal{D} .

0109 REMARK 4.2.2 ► UNWINDING DEFINITION 4.2.1

In detail, a **contravariant functor** from \mathcal{C} to \mathcal{D} consists of:

1. *Action on Objects.* A map of sets

$$F: \text{Obj}(\mathcal{C}) \rightarrow \text{Obj}(\mathcal{D}),$$

called the **action on objects of F** .

2. *Action on Morphisms.* For each $A, B \in \text{Obj}(\mathcal{C})$, a map

$$F_{A,B}: \text{Hom}_{\mathcal{C}}(A, B) \rightarrow \text{Hom}_{\mathcal{D}}(F(B), F(A)),$$

called the **action on morphisms of F at (A, B)** .

satisfying the following conditions:

1. *Preservation of Identities.* For each $A \in \text{Obj}(\mathcal{C})$, the diagram

$$\begin{array}{ccc} \text{pt} & & \\ \mathbb{1}_A^{\mathcal{C}} \downarrow & \searrow \mathbb{1}_{F(A)}^{\mathcal{D}} & \\ \text{Hom}_{\mathcal{C}}(A, A) & \xrightarrow{F_{A,A}} & \text{Hom}_{\mathcal{D}}(F(A), F(A)) \end{array}$$

commutes, i.e. we have

$$F(\text{id}_A) = \text{id}_{F(A)}.$$

2. *Preservation of Composition.* For each $A, B, C \in \text{Obj}(C)$, the diagram

$$\begin{array}{ccc}
 & \text{Hom}_{\mathcal{D}}(F(C), F(B)) \times \text{Hom}_{\mathcal{D}}(F(B), F(A)) & \\
 F_{B,C} \times F_{A,B} \nearrow & & \searrow \sigma_{\text{Hom}_{\mathcal{D}}(F(C), F(B)), \text{Hom}_{\mathcal{D}}(F(B), F(A))}^{\text{Sets}} \\
 \text{Hom}_C(B, C) \times \text{Hom}_C(A, B) & & \text{Hom}_{\mathcal{D}}(F(B), F(A)) \times \text{Hom}_{\mathcal{D}}(F(C), F(B)) \\
 \circ_{A,B,C}^C \searrow & & \searrow \circ_{F(C), F(B), F(A)}^{\mathcal{D}} \\
 \text{Hom}_C(A, C) & \xrightarrow{F_{A,C}} & \text{Hom}_{\mathcal{D}}(F(C), F(A))
 \end{array}$$

commutes, i.e. for each composable pair (g, f) of morphisms of C , we have

$$F(g \circ f) = F(f) \circ F(g).$$

010A

REMARK 4.2.3 ► ON THE TERM CONTRAVARIANT FUNCTOR

Throughout this work we will not use the term “contravariant” functor, speaking instead simply of functors $F: C^{\text{op}} \rightarrow \mathcal{D}$. We will usually, however, write

$$F_{A,B}: \text{Hom}_C(A, B) \rightarrow \text{Hom}_{\mathcal{D}}(F(B), F(A))$$

for the action on morphisms

$$F_{A,B}: \text{Hom}_{C^{\text{op}}}(A, B) \rightarrow \text{Hom}_{\mathcal{D}}(F(A), F(B))$$

of F , as well as write $F(g \circ f) = F(f) \circ F(g)$.

010B 4.3 Forgetful Functors

010C DEFINITION 4.3.1 ► FORGETFUL FUNCTORS

There isn't a precise definition of a **forgetful functor**.

010D REMARK 4.3.2 ► UNWINDING DEFINITION 4.3.1

Despite there not being a formal or precise definition of a forgetful functor, the term is often very useful in practice, similarly to the word “canonical”. The idea is that a “forgetful functor” is a functor that forgets structure or properties, and is best explained through examples, such as the ones below (see [Examples 4.3.3](#) and [4.3.4](#)).

010E EXAMPLE 4.3.3 ► FORGETFUL FUNCTORS THAT FORGET STRUCTURE

Examples of forgetful functors that forget structure include:

- 010F 1. *Forgetting Group Structures.* The functor $\text{Grp} \rightarrow \text{Sets}$ sending a group (G, μ_G, η_G) to its underlying set G , forgetting the multiplication and unit maps μ_G and η_G of G .
- 010G 2. *Forgetting Topologies.* The functor $\text{Top} \rightarrow \text{Sets}$ sending a topological space (X, \mathcal{T}_X) to its underlying set X , forgetting the topology \mathcal{T}_X .
- 010H 3. *Forgetting Fibrations.* The functor $\text{FibSets}(K) \rightarrow \text{Sets}$ sending a K -fibred set $\phi_X: X \rightarrow K$ to the set X , forgetting the map ϕ_X and the base set K .

010J EXAMPLE 4.3.4 ► FORGETFUL FUNCTORS THAT FORGET PROPERTIES

Examples of forgetful functors that forget properties include:

- 010K 1. *Forgetting Commutativity.* The inclusion functor $\iota: \text{CMon} \hookrightarrow \text{Mon}$ which forgets the property of being commutative.
- 010L 2. *Forgetting Inverses.* The inclusion functor $\iota: \text{Grp} \hookrightarrow \text{Mon}$ which forgets the property of having inverses.

NOTATION 4.3.5 ► NOTATION FOR FORGETFUL FUNCTORS THAT FORGET STRUCTURE

Throughout this work, we will denote forgetful functors that forget structure by 忘 , e.g. as in

忘: $\text{Grp} \rightarrow \text{Sets}$.

The symbol 忘, pronounced *wasureru* (see [Item 1](#) of [Remark 4.3.6](#) below), means *to forget*, and is a kanji found in the following words in Japanese and Chinese:

1. 忘れる, transcribed as *wasureru*, meaning *to forget*.
2. 忘却関手, transcribed as *boukyaku kanshu*, meaning *forgetful functor*.
3. 忘记 or 忘記, transcribed as *wàngjì*, meaning *to forget*.
4. 遗忘函子 or 遺忘函子, transcribed as *yíwàng hánzǐ*, meaning *forgetful functor*.

010X 4.4 The Natural Transformation Associated to a Functor

010Y

DEFINITION 4.4.1 ► THE NATURAL TRANSFORMATION ASSOCIATED TO A FUNCTOR

Every functor $F: C \rightarrow D$ defines a natural transformation¹

$$F^\dagger: \text{Hom}_C \Rightarrow \text{Hom}_D \circ (F^{\text{op}} \times F),$$

$$\begin{array}{ccc} C^{\text{op}} \times C & \xrightarrow{F^{\text{op}} \times F} & D^{\text{op}} \times D \\ \searrow & \Downarrow F^\dagger & \swarrow \\ \text{Hom}_C & & \text{Hom}_D \end{array}$$

Sets,

called the **natural transformation associated to F** , consisting of the collection

$$\left\{ F_{A,B}^\dagger: \text{Hom}_C(A, B) \rightarrow \text{Hom}_D(F_A, F_B) \right\}_{(A,B) \in \text{Obj}(C^{\text{op}} \times C)}$$

with

$$F_{A,B}^\dagger \stackrel{\text{def}}{=} F_{A,B}.$$

¹This is the 1-categorical version of [Constructions With Sets, Item 1](#) of [Proposition 4.1.3](#).

PROOF 4.4.2 ► PROOF OF DEFINITION 4.4.1

The naturality condition for F^\dagger is the requirement that for each morphism

$$(\phi, \psi): (X, Y) \rightarrow (A, B)$$

of $C^{\text{op}} \times C$, the diagram

$$\begin{array}{ccc} \text{Hom}_C(X, Y) & \xrightarrow{\phi^* \circ \psi_* = \psi_* \circ \phi^*} & \text{Hom}_C(A, B) \\ \downarrow F_{X,Y} & & \downarrow F_{A,B} \\ \text{Hom}_{\mathcal{D}}(F_X, F_Y) & \xrightarrow{F(\phi)^* \circ F(\psi)_* = F(\psi)_* \circ F(\phi)^*} & \text{Hom}_{\mathcal{D}}(F_A, F_B), \end{array}$$

acting on elements as

$$\begin{array}{ccc} f & \longmapsto & \psi \circ f \circ \phi \\ \downarrow & & \downarrow \\ F(f) & \longmapsto & F(\psi) \circ F(f) \circ F(\phi) = F(\psi \circ f \circ \phi) \end{array}$$

commutes, which follows from the functoriality of F . 

PROPOSITION 4.4.3 ► PROPERTIES OF NATURAL TRANSFORMATIONS ASSOCIATED TO FUNCTORS

Let $F: C \rightarrow \mathcal{D}$ and $G: \mathcal{D} \rightarrow \mathcal{E}$ be functors.

1. *Interaction With Natural Isomorphisms.* The following conditions are equivalent:

- (a) The natural transformation $F^\dagger: \text{Hom}_C \Rightarrow \text{Hom}_{\mathcal{D}} \circ (F^{\text{op}} \times F)$ associated to F is a natural isomorphism.
- (b) The functor F is fully faithful.

0113

2. *Interaction With Composition.* We have an equality of pasting diagrams

$$\begin{array}{ccc}
 C^{\text{op}} \times C & \xrightarrow{F^{\text{op}} \times F} \mathcal{D}^{\text{op}} \times \mathcal{D} & \xrightarrow{G^{\text{op}} \times G} \mathcal{E}^{\text{op}} \times \mathcal{E} \\
 \searrow \text{Hom}_C & \Downarrow F^\dagger & \Downarrow G^\dagger \\
 & \text{Hom}_{\mathcal{D}} & \searrow \text{Hom}_{\mathcal{E}} \\
 & \text{Sets} &
 \end{array}
 =
 \begin{array}{ccc}
 C^{\text{op}} \times C & \xrightarrow{(G \circ F)^{\text{op}} \times (G \circ F)} \mathcal{E}^{\text{op}} \times \mathcal{E}, \\
 \searrow \text{Hom}_C & \Downarrow (G \circ F)^\dagger & \searrow \text{Hom}_{\mathcal{E}} \\
 & \text{Sets} &
 \end{array}$$

in Cats_2 , i.e. we have

$$(G \circ F)^\dagger = (G^\dagger \star \text{id}_{F^{\text{op}} \times F}) \circ F^\dagger.$$

0114

3. *Interaction With Identities.* We have

$$\text{id}_C^\dagger = \text{id}_{\text{Hom}_C(-1, -2)},$$

i.e. the natural transformation associated to id_C is the identity natural transformation of the functor $\text{Hom}_C(-1, -2)$.

0132 5.4 Conservative Functors

Let \mathcal{C} and \mathcal{D} be categories.

0133 DEFINITION 5.4.1 ► CONSERVATIVE FUNCTORS

A functor $F: \mathcal{C} \rightarrow \mathcal{D}$ is **conservative** if it satisfies the following condition:¹

- (★) For each $f \in \text{Mor}(\mathcal{C})$, if $F(f)$ is an isomorphism in \mathcal{D} , then f is an isomorphism in \mathcal{C} .

¹Slogan: A functor F is **conservative** if it reflects isomorphisms.

0134 PROPOSITION 5.4.2 ► PROPERTIES OF CONSERVATIVE FUNCTORS

Let $F: \mathcal{C} \rightarrow \mathcal{D}$ be a functor.

- 0135 1. *Characterisations.* The following conditions are equivalent:
 - 0136 (a) The functor F is conservative.
 - 0137 (b) For each $f \in \text{Mor}(\mathcal{C})$, the morphism $F(f)$ is an isomorphism in \mathcal{D} iff f is an isomorphism in \mathcal{C} .
- 0138 2. *Interaction With Fully Faithfulness.* Every fully faithful functor is conservative.

- 0139 3. *Interaction With Precomposition.* The following conditions are equivalent:
- 013A (a) For each $\mathcal{X} \in \text{Obj}(\text{Cats})$, the precomposition functor
- $$F^* : \text{Fun}(\mathcal{D}, \mathcal{X}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{X})$$
- is conservative.
- 013B (b) The equivalent conditions of [Item 4](#) of [Proposition 5.1.2](#) are satisfied.

PROOF 5.4.3 ► PROOF OF PROPOSITION 5.4.2

Item 1: Characterisations

This follows from [Item 1](#) of [Proposition 4.1.8](#).

Item 2: Interaction With Fully Faithfulness

Let $F : \mathcal{C} \rightarrow \mathcal{D}$ be a fully faithful functor, let $f : A \rightarrow B$ be a morphism of \mathcal{C} , and suppose that F_f is an isomorphism. We have

$$\begin{aligned} F(\text{id}_B) &= \text{id}_{F(B)} \\ &= F(f) \circ F(f)^{-1} \\ &= F(f \circ f^{-1}). \end{aligned}$$

Similarly, $F(\text{id}_A) = F(f^{-1} \circ f)$. But since F is fully faithful, we must have

$$\begin{aligned} f \circ f^{-1} &= \text{id}_B, \\ f^{-1} \circ f &= \text{id}_A, \end{aligned}$$

showing f to be an isomorphism. Thus F is conservative. 

QUESTION 5.4.4 ► CHARACTERISATIONS OF FUNCTORS WITH CONSERVATIVE PRE/POST-COMPOSITION

013C

Is there a characterisation of functors $F : \mathcal{C} \rightarrow \mathcal{D}$ satisfying the following condition:

- (★) For each $\mathcal{X} \in \text{Obj}(\text{Cats})$, the postcomposition functor

$$F_* : \text{Fun}(\mathcal{X}, \mathcal{C}) \rightarrow \text{Fun}(\mathcal{X}, \mathcal{D})$$

013D 5.5 Essentially Injective Functors

Let \mathcal{C} and \mathcal{D} be categories.

013E DEFINITION 5.5.1 ► ESSENTIALLY INJECTIVE FUNCTORS

- 013G 1. For each $\mathcal{X} \in \text{Obj}(\text{Cats})$, the precomposition functor

$$F^*: \text{Fun}(\mathcal{D}, \mathcal{X}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{X})$$

is essentially injective, i.e. if $\phi \circ F \cong \psi \circ F$, then $\phi \cong \psi$ for all functors ϕ and ψ ?

- 013H 2. For each $\mathcal{X} \in \text{Obj}(\text{Cats})$, the postcomposition functor

$$F_*: \text{Fun}(\mathcal{X}, \mathcal{C}) \rightarrow \text{Fun}(\mathcal{X}, \mathcal{D})$$

is essentially injective, i.e. if $F \circ \phi \cong F \circ \psi$, then $\phi \cong \psi$?

This question also appears as [MO 468121a].

013J 5.6 Essentially Surjective Functors

013K

DEFINITION 5.6.1 ► ESSENTIALLY SURJECTIVE FUNCTORS

A functor $F: \mathcal{C} \rightarrow \mathcal{D}$ is **essentially surjective**¹ if it satisfies the following condition:

- (★) For each $D \in \text{Obj}(\mathcal{D})$, there exists some object A of \mathcal{C} such that $F(A) \cong D$.

¹*Further Terminology:* Also called an **eso** functor, where the name “eso” comes from *essentially surjective on objects*.

013L

QUESTION 5.6.2 ► CHARACTERISATIONS OF FUNCTORS WITH ESSENTIALLY SURJECTIVE PRE/POSTCOMPOSITION

Is there a characterisation of functors $F: \mathcal{C} \rightarrow \mathcal{D}$ such that:

013M

1. For each $\mathcal{X} \in \text{Obj}(\text{Cats})$, the precomposition functor

$$F^*: \text{Fun}(\mathcal{D}, \mathcal{X}) \rightarrow \text{Fun}(\mathcal{C}, \mathcal{X})$$

is essentially surjective?

013N

2. For each $\mathcal{X} \in \text{Obj}(\text{Cats})$, the postcomposition functor

$$F_*: \text{Fun}(\mathcal{X}, \mathcal{C}) \rightarrow \text{Fun}(\mathcal{X}, \mathcal{D})$$

is essentially surjective?

This question also appears as [M0 468121a].

013P 5.7 Equivalences of Categories

013Q

DEFINITION 5.7.1 ► EQUIVALENCES OF CATEGORIES

Let \mathcal{C} and \mathcal{D} be categories.

013R

1. An **equivalence of categories** between \mathcal{C} and \mathcal{D} consists of a pair of functors

$$F: \mathcal{C} \rightarrow \mathcal{D},$$

$$G: \mathcal{D} \rightarrow \mathcal{C}$$

together with natural isomorphisms

$$\eta: \text{id}_C \xRightarrow{\sim} G \circ F,$$

$$\epsilon: F \circ G \xRightarrow{\sim} \text{id}_D.$$

2. An **adjoint equivalence of categories** between C and D is an equivalence (F, G, η, ϵ) between C and D which is also an adjunction.

013S

013T

PROPOSITION 5.7.2 ► PROPERTIES OF EQUIVALENCES OF CATEGORIES

Let $F: C \rightarrow D$ be a functor.

013U

1. *Characterisations.* If C and D are small¹, then the following conditions are equivalent:²

013V

(a) The functor F is an equivalence of categories.

013W

(b) The functor F is fully faithful and essentially surjective.

013X

(c) The induced functor

$$\downarrow F\text{Sk}(C): \text{Sk}(C) \rightarrow \text{Sk}(D)$$

is an *isomorphism* of categories.

013Y

(d) For each $X \in \text{Obj}(\text{Cats})$, the precomposition functor

$$F^*: \text{Fun}(D, X) \rightarrow \text{Fun}(C, X)$$

is an equivalence of categories.

013Z

(e) For each $X \in \text{Obj}(\text{Cats})$, the postcomposition functor

$$F_*: \text{Fun}(X, C) \rightarrow \text{Fun}(X, D)$$

is an equivalence of categories.

0140

2. *Two-Out-of-Three.* Let

$$\begin{array}{ccc} C & \xrightarrow{GoF} & E \\ F \searrow & & \nearrow G \\ & D & \end{array}$$

be a diagram in \mathbf{Cats} . If two out of the three functors among F , G , and $G \circ F$ are equivalences of categories, then so is the third.

0141

3. *Stability Under Composition.* Let

$$C \begin{array}{c} \xrightarrow{F} \\ \xleftarrow{G} \end{array} \mathcal{D} \begin{array}{c} \xrightarrow{F'} \\ \xleftarrow{G'} \end{array} \mathcal{E}$$

be a diagram in \mathbf{Cats} . If (F, G) and (F', G') are equivalences of categories, then so is their composite $(F' \circ F, G' \circ G)$.

0142

4. *Equivalences vs. Adjoint Equivalences.* Every equivalence of categories can be promoted to an adjoint equivalence.³

0143

5. *Interaction With Groupoids.* If C and \mathcal{D} are groupoids, then the following conditions are equivalent:

0144

(a) The functor F is an equivalence of groupoids.

0145

(b) The following conditions are satisfied:

0146

i. The functor F induces a bijection

$$\pi_0(F) : \pi_0(C) \rightarrow \pi_0(\mathcal{D})$$

of sets.

0147

ii. For each $A \in \text{Obj}(C)$, the induced map

$$F_{x,x} : \text{Aut}_C(A) \rightarrow \text{Aut}_{\mathcal{D}}(F_A)$$

is an isomorphism of groups.

¹Otherwise there will be size issues. One can also work with large categories and universes, or require F to be *constructively* essentially surjective; see [MSE 1465107].

²In ZFC, the equivalence between [Item 1a](#) and [Item 1b](#) is equivalent to the axiom of choice; see [MO 119454].

In Univalent Foundations, this is true without requiring neither the axiom of choice nor the law of excluded middle.

³More precisely, we can promote an equivalence of categories (F, G, η, ϵ) to adjoint equivalences (F, G, η', ϵ) and (F, G, η, ϵ') .

PROOF 5.7.3 ► PROOF OF PROPOSITION 5.7.2

Item 1: Characterisations

We claim that **Items 1a to 1e** are indeed equivalent:

1. **Item 1a** \implies **Item 1b**: Clear.
2. **Item 1b** \implies **Item 1a**: Since F is essentially surjective and \mathcal{C} and \mathcal{D} are small, we can choose, using the axiom of choice, for each $B \in \text{Obj}(\mathcal{D})$, an object j_B of \mathcal{C} and an isomorphism $i_B: B \rightarrow F_{j_B}$ of \mathcal{D} .
Since F is fully faithful, we can extend the assignment $B \mapsto j_B$ to a *unique* functor $j: \mathcal{D} \rightarrow \mathcal{C}$ such that the isomorphisms $i_B: B \rightarrow F_{j_B}$ assemble into a natural isomorphism $\eta: \text{id}_{\mathcal{D}} \xrightarrow{\sim} F \circ j$, with a similar natural isomorphism $\epsilon: \text{id}_{\mathcal{C}} \xrightarrow{\sim} j \circ F$. Hence F is an equivalence.
3. **Item 1a** \implies **Item 1c**: This follows from **Item 4** of **Proposition 1.5.3**.
4. **Item 1c** \implies **Item 1a**: Omitted.
5. **Items 1a, 1d and 1e Are Equivalent**: This follows from ??.

This finishes the proof of **Item 1**.

Item 2: Two-Out-of-Three

Omitted.

Item 3: Stability Under Composition

Clear.

Item 4: Equivalences vs. Adjoint Equivalences

See **[Rie17, Proposition 4.4.5]**.

Item 5: Interaction With Groupoids

See **[nLa24, Proposition 4.4]**. 

0149 DEFINITION 5.8.1 ► ISOMORPHISMS OF CATEGORIES

$$G: \mathcal{D} \rightarrow \mathcal{C}$$

such that we have

$$G \circ F = \text{id}_{\mathcal{C}},$$

$$F \circ G = \text{id}_{\mathcal{D}}.$$

014A EXAMPLE 5.8.2 ► EQUIVALENT BUT NON-ISOMORPHIC CATEGORIES

In detail, a functor $F: \mathcal{C} \rightarrow \mathcal{D}$ is **corepresentably fully faithful on cores** if it satisfies the conditions in [Remarks 7.7.2](#) and [7.8.2](#), i.e.:

- 017G 1. For all diagrams of the form

$$\mathcal{C} \xrightarrow{F} \mathcal{D} \begin{array}{c} \xrightarrow{\phi} \\ \alpha \Downarrow \beta \\ \xrightarrow{\psi} \end{array} \mathcal{X},$$

if α and β are natural isomorphisms and we have

$$\alpha \star \text{id}_F = \beta \star \text{id}_F,$$

then $\alpha = \beta$.

- 017H 2. For each $X \in \text{Obj}(\text{Cats})$ and each natural isomorphism

$$\beta: \phi \circ F \xrightarrow{\sim} \psi \circ F, \quad \mathcal{C} \begin{array}{c} \xrightarrow{\phi \circ F} \\ \beta \Downarrow \\ \xrightarrow{\psi \circ F} \end{array} \mathcal{X},$$

there exists a natural isomorphism

$$\alpha: \phi \xrightarrow{\sim} \psi, \quad \mathcal{D} \begin{array}{c} \xrightarrow{\phi} \\ \alpha \Downarrow \\ \xrightarrow{\psi} \end{array} \mathcal{X}$$

such that we have an equality

$$\mathcal{X} \begin{array}{c} \xrightarrow{\phi} \\ \alpha \Downarrow \\ \xrightarrow{\psi} \end{array} \mathcal{C} \xrightarrow{F} \mathcal{D} = \mathcal{X} \begin{array}{c} \xrightarrow{F \circ \phi} \\ \beta \Downarrow \\ \xrightarrow{F \circ \psi} \end{array} \mathcal{D}$$

of pasting diagrams in \mathbf{Cats}_2 , i.e. such that we have

$$\beta = \alpha \star \mathrm{id}_F.$$

QUESTION 7.9.3 ► CHARACTERISATION OF FUNCTORS COREPRESENTABLY FULLY FAITHFUL ON CORES

017J

Is there a characterisation of functors corepresentably fully faithful on cores?

017K 8 Natural Transformations

017L 8.1 Transformations

Let \mathcal{C} and \mathcal{D} be categories and $F, G: \mathcal{C} \Rightarrow \mathcal{D}$ be functors.

017M DEFINITION 8.1.1 ► TRANSFORMATIONS

A **transformation**¹ $\alpha: F \Rightarrow G$ **from** F **to** G is a collection

$$\{\alpha_A: F(A) \rightarrow G(A)\}_{A \in \mathrm{Obj}(\mathcal{C})}$$

of morphisms of \mathcal{D} .

¹*Further Terminology:* Also called an **unnatural transformation** for emphasis.

017N NOTATION 8.1.2 ► THE SET OF TRANSFORMATIONS BETWEEN TWO FUNCTORS

We write $\mathrm{Trans}(F, G)$ for the set of transformations from F to G .

017P 8.2 Natural Transformations

Let \mathcal{C} and \mathcal{D} be categories and $F, G: \mathcal{C} \Rightarrow \mathcal{D}$ be functors.

017Q

DEFINITION 8.2.1 ► NATURAL TRANSFORMATIONS

A **natural transformation** $\alpha: F \Longrightarrow G$ **from** F **to** G is a transformation

$$\{\alpha_A: F(A) \rightarrow G(A)\}_{A \in \text{Obj}(C)}$$

from F to G such that, for each morphism $f: A \rightarrow B$ of C , the diagram

$$\begin{array}{ccc} F(A) & \xrightarrow{F(f)} & F(B) \\ \alpha_A \downarrow & & \downarrow \alpha_B \\ G(A) & \xrightarrow{G(f)} & G(B) \end{array}$$

commutes.¹

¹*Further Terminology:* The morphism $\alpha_A: F_A \rightarrow G_A$ is called the **component of α at A** .

017R

REMARK 8.2.2 ► PICTURING NATURAL TRANSFORMATIONS IN DIAGRAMS

We denote natural transformations in diagrams as

$$C \begin{array}{c} \xrightarrow{F} \\ \alpha \Downarrow \\ \xrightarrow{G} \end{array} \mathcal{D}.$$

017S

NOTATION 8.2.3 ► THE SET OF NATURAL TRANSFORMATIONS BETWEEN TWO FUNCTORS

We write $\text{Nat}(F, G)$ for the set of natural transformations from F to G .

017T

EXAMPLE 8.2.4 ► IDENTITY NATURAL TRANSFORMATIONS

The **identity natural transformation** $\text{id}_F: F \Longrightarrow F$ **of** F is the natural transformation consisting of the collection

$$\{\text{id}_{F(A)}: F(A) \rightarrow F(A)\}_{A \in \text{Obj}(C)}.$$

PROOF 8.2.5 ► PROOF OF EXAMPLE 8.2.4

The naturality condition for id_F is the requirement that, for each morphism $f: A \rightarrow B$ of C , the diagram

$$\begin{array}{ccc} F(A) & \xrightarrow{F(f)} & F(B) \\ \text{id}_{F(A)} \downarrow & & \downarrow \text{id}_{F(B)} \\ F(A) & \xrightarrow{F(f)} & F(B) \end{array}$$

commutes, which follows from unitality of the composition of C . 

017U

DEFINITION 8.2.6 ► EQUALITY OF NATURAL TRANSFORMATIONS

Two natural transformations $\alpha, \beta: F \Rightarrow G$ are **equal** if we have

$$\alpha_A = \beta_A$$

for each $A \in \text{Obj}(C)$.

017V 8.3 Vertical Composition of Natural Transformations

017W

DEFINITION 8.3.1 ► VERTICAL COMPOSITION OF NATURAL TRANSFORMATIONS

The **vertical composition** of two natural transformations $\alpha: F \Rightarrow G$ and $\beta: G \Rightarrow H$ as in the diagram

$$\begin{array}{ccc} & F & \\ \alpha \downarrow & \curvearrowright & \\ C & \xrightarrow{G} & \mathcal{D} \\ \beta \downarrow & \curvearrowleft & \\ & H & \end{array}$$

is the natural transformation $\beta \circ \alpha: F \Rightarrow H$ consisting of the collection

$$\{(\beta \circ \alpha)_A: F(A) \rightarrow H(A)\}_{A \in \text{Obj}(C)}$$

with

$$(\beta \circ \alpha)_A \stackrel{\text{def}}{=} \beta_A \circ \alpha_A$$

for each $A \in \text{Obj}(C)$.

PROOF 8.3.2 ► PROOF OF DEFINITION 8.3.1

The naturality condition for $\beta \circ \alpha$ is the requirement that the boundary of the diagram

$$\begin{array}{ccc}
 F(A) & \xrightarrow{F(f)} & F(B) \\
 \alpha_A \downarrow & (1) & \downarrow \alpha_B \\
 G(A) & \xrightarrow{G(f)} & G(B) \\
 \beta_A \downarrow & (2) & \downarrow \beta_B \\
 H(A) & \xrightarrow{H(f)} & H(B)
 \end{array}$$

commutes. Since

1. Subdiagram (1) commutes by the naturality of α .
2. Subdiagram (2) commutes by the naturality of β .

so does the boundary diagram. Hence $\beta \circ \alpha$ is a natural transformation. 

PROPOSITION 8.3.3 ► PROPERTIES OF VERTICAL COMPOSITION OF NATURAL TRANSFORMATIONS

Let C , \mathcal{D} , and \mathcal{E} be categories.

1. *Functionality.* The assignment $(\beta, \alpha) \mapsto \beta \circ \alpha$ defines a function

$$\circ_{F,G,H}: \text{Nat}(G, H) \times \text{Nat}(F, G) \rightarrow \text{Nat}(F, H).$$

017Z

2. *Associativity.* Let $F, G, H, K: C \rightrightarrows \mathcal{D}$ be functors. The diagram

$$\begin{array}{ccc}
 & \text{Nat}(H, K) \times (\text{Nat}(G, H) \times \text{Nat}(F, G)) & \\
 \alpha_{\text{Nat}(H, K), \text{Nat}(G, H), \text{Nat}(F, G)}^{\text{Sets}} \nearrow \sim & & \searrow \text{id}_{\text{Nat}(H, K)} \times \circ_{F, G, H} \\
 (\text{Nat}(H, K) \times \text{Nat}(G, H)) \times \text{Nat}(F, G) & & \text{Nat}(H, K) \times \text{Nat}(F, H) \\
 \circ_{G, H, K} \times \text{id}_{\text{Nat}(F, G)} \searrow & & \searrow \circ_{F, H, K} \\
 \text{Nat}(G, K) \times \text{Nat}(F, G) & \xrightarrow{\circ_{F, G, K}} & \text{Nat}(F, K)
 \end{array}$$

commutes, i.e. given natural transformations

$$F \xRightarrow{\alpha} G \xRightarrow{\beta} H \xRightarrow{\gamma} K,$$

we have

$$(\gamma \circ \beta) \circ \alpha = \gamma \circ (\beta \circ \alpha).$$

0180

3. *Unitality.* Let $F, G: C \rightrightarrows \mathcal{D}$ be functors.

(a) *Left Unitality.* The diagram

$$\begin{array}{ccc}
 \text{pt} \times \text{Nat}(F, G) & & \\
 [\text{id}_G] \times \text{id}_{\text{Nat}(F, G)} \downarrow & \nearrow \lambda_{\text{Nat}(F, G)}^{\text{Sets}} \sim & \\
 \text{Nat}(G, G) \times \text{Nat}(F, G) & \xrightarrow{\circ_{F, G, G}} & \text{Nat}(F, G)
 \end{array}$$

commutes, i.e. given a natural transformation $\alpha: F \Rightarrow G$, we have

$$\text{id}_G \circ \alpha = \alpha.$$

(b) *Right Unitality*. The diagram

$$\begin{array}{ccc}
 \text{Nat}(F, G) \times \text{pt} & & \\
 \downarrow \text{id}_{\text{Nat}(F, G)} \times [\text{id}_F] & \searrow \rho_{\text{Nat}(F, G)}^{\text{Sets}} & \\
 \text{Nat}(F, G) \times \text{Nat}(F, F) & \xrightarrow{\circ_{F, F, G}^C} & \text{Nat}(F, G)
 \end{array}$$

commutes, i.e. given a natural transformation $\alpha: F \Rightarrow G$, we have

$$\alpha \circ \text{id}_F = \alpha.$$

0181

4. *Middle Four Exchange*. Let $F_1, F_2, F_3: \mathcal{C} \rightarrow \mathcal{D}$ and $G_1, G_2, G_3: \mathcal{D} \rightarrow \mathcal{E}$ be functors. The diagram

$$\begin{array}{ccc}
 (\text{Nat}(G_2, G_3) \times \text{Nat}(G_1, G_2)) \times (\text{Nat}(F_2, F_3) \times \text{Nat}(F_1, F_2)) & \xleftarrow{\mu_4} & (\text{Nat}(G_2, G_3) \times \text{Nat}(F_2, F_3)) \times (\text{Nat}(G_1, G_2) \times \text{Nat}(F_1, F_2)) \\
 \downarrow \circ_{G_1, G_2, G_3} \times \circ_{F_1, F_2, F_3} & & \downarrow *_{F_2, F_3, G_2, G_3} \times *_{F_1, F_2, G_1, G_2} \\
 \text{Nat}(G_1, G_3) \times \text{Nat}(F_1, F_3) & & \text{Nat}(G_2 \circ F_2, G_3 \circ F_3) \times \text{Nat}(G_1 \circ F_1, G_2 \circ F_2) \\
 \searrow *_{F_1, F_3, G_1, G_3} & & \swarrow \circ_{G_1 \circ F_1, G_2 \circ F_2, G_3 \circ F_3} \\
 & \text{Nat}(G_1 \circ F_1, G_3 \circ F_3) &
 \end{array}$$

commutes, i.e. given a diagram

$$\begin{array}{ccccc}
 & F_1 & & G_1 & \\
 & \downarrow \alpha & & \downarrow \beta & \\
 C & \xrightarrow{F_2} & \mathcal{D} & \xrightarrow{G_2} & \mathcal{E} \\
 & \downarrow \alpha' & & \downarrow \beta' & \\
 & F_3 & & G_3 &
 \end{array}$$

in Cats_2 , we have

$$(\beta' \star \alpha') \circ (\beta \star \alpha) = (\beta' \circ \beta) \star (\alpha' \circ \alpha).$$

PROOF 8.3.4 ► PROOF OF PROPOSITION 8.3.3**Item 1: Functionality**

Clear.

Item 2: Associativity

Indeed, we have

$$\begin{aligned}
 ((\gamma \circ \beta) \circ \alpha)_A &\stackrel{\text{def}}{=} (\gamma \circ \beta)_A \circ \alpha_A \\
 &\stackrel{\text{def}}{=} (\gamma_A \circ \beta_A) \circ \alpha_A \\
 &= \gamma_A \circ (\beta_A \circ \alpha_A) \\
 &\stackrel{\text{def}}{=} \gamma_A \circ (\beta \circ \alpha)_A \\
 &\stackrel{\text{def}}{=} (\gamma \circ (\beta \circ \alpha))_A
 \end{aligned}$$

for each $A \in \text{Obj}(C)$, showing the desired equality.

Item 3: Unitality

We have

$$\begin{aligned}
 (\text{id}_G \circ \alpha)_A &= \text{id}_G \circ \alpha_A \\
 &= \alpha_A, \\
 (\alpha \circ \text{id}_F)_A &= \alpha_A \circ \text{id}_F \\
 &= \alpha_A
 \end{aligned}$$

for each $A \in \text{Obj}(C)$, showing the desired equality.

Item 4: Middle Four Exchange

This is proved in [Item 4 of Proposition 8.4.4](#). 

0182 8.4 Horizontal Composition of Natural Transformations**0183 DEFINITION 8.4.1 ► HORIZONTAL COMPOSITION OF NATURAL TRANSFORMATIONS**

The **horizontal composition**^{1,2} of two natural transformations $\alpha: F \Rightarrow G$ and $\beta: H \Rightarrow K$ as in the diagram

$$\begin{array}{ccccc} C & \xrightarrow{F} & \mathcal{D} & \xrightarrow{H} & \mathcal{E} \\ & \alpha \Downarrow & & \beta \Downarrow & \\ & G & & K & \end{array}$$

of α and β is the natural transformation

$$\beta \star \alpha: (H \circ F) \Rightarrow (K \circ G),$$

as in the diagram

$$\begin{array}{ccc} C & \xrightarrow{H \circ F} & \mathcal{E} \\ & \parallel & \\ & \beta \star \alpha & \\ & \Downarrow & \\ & K \circ G & \end{array}$$

consisting of the collection

$$\{(\beta \star \alpha)_A: H(F(A)) \rightarrow K(G(A))\}_{A \in \text{Obj}(\mathcal{C})},$$

of morphisms of \mathcal{E} with

$$\begin{array}{ccc} H(F(A)) & \xrightarrow{H(\alpha_A)} & H(G(A)) \\ \beta_{F(A)} \downarrow & & \downarrow \beta_{G(A)} \\ K(F(A)) & \xrightarrow{K(\alpha_A)} & K(G(A)). \end{array}$$

$$\begin{aligned} (\beta \star \alpha)_A &\stackrel{\text{def}}{=} \beta_{G(A)} \circ H(\alpha_A) \\ &= K(\alpha_A) \circ \beta_{F(A)}, \end{aligned}$$

¹*Further Terminology:* Also called the **Godement product** of α and β .

²Horizontal composition forms a map

$$\star_{(F,H),(G,K)}: \text{Nat}(H, K) \times \text{Nat}(F, G) \rightarrow \text{Nat}(H \circ F, K \circ G).$$

PROOF 8.4.2 ► PROOF OF DEFINITION 8.4.1

First, we claim that we indeed have

$$\beta_{G(A)} \circ H(\alpha_A) = K(\alpha_A) \circ \beta_{F(A)}, \quad \begin{array}{ccc} H(F(A)) & \xrightarrow{H(\alpha_A)} & H(G(A)) \\ \beta_{F(A)} \downarrow & & \downarrow \beta_{G(A)} \\ K(F(A)) & \xrightarrow{K(\alpha_A)} & K(G(A)). \end{array}$$

This is, however, simply the naturality square for β applied to the morphism $\alpha_A: F(A) \rightarrow G(A)$. Next, we check the naturality condition for $\beta \star \alpha$, which is the requirement that the boundary of the diagram

$$\begin{array}{ccc} H(F(A)) & \xrightarrow{H(F(f))} & H(F(B)) \\ \downarrow H(\alpha_A) & (1) & \downarrow H(\alpha_B) \\ H(G(A)) & \xrightarrow{H(G(f))} & H(G(B)) \\ \downarrow \beta_{G(A)} & (2) & \downarrow \beta_{G(B)} \\ K(G(A)) & \xrightarrow{K(G(f))} & K(G(B)) \end{array}$$

commutes. Since

1. Subdiagram (1) commutes by the naturality of α .
2. Subdiagram (2) commutes by the naturality of β .

so does the boundary diagram. Hence $\beta \circ \alpha$ is a natural transformation.¹

commutes, i.e. we have

PROOF 8.4.5 ► PROOF OF PROPOSITION 8.4.4

Item 1: Functionality

Clear.

Item 2: Associativity

Omitted.

Item 3: Interaction With Identities

We have

$$\begin{aligned}
 (\mathrm{id}_G \star \mathrm{id}_F)_A &\stackrel{\mathrm{def}}{=} (\mathrm{id}_G)_{F_A} \circ G_{(\mathrm{id}_F)_A} \\
 &\stackrel{\mathrm{def}}{=} \mathrm{id}_{G_{F_A}} \circ G_{\mathrm{id}_{F_A}} \\
 &= \mathrm{id}_{G_{F_A}} \circ \mathrm{id}_{G_{F_A}} \\
 &= \mathrm{id}_{G_{F_A}} \\
 &\stackrel{\mathrm{def}}{=} (\mathrm{id}_{G \circ F})_A
 \end{aligned}$$

for each $A \in \mathrm{Obj}(C)$, showing the desired equality.

Item 4: Middle Four Exchange

Let $A \in \mathrm{Obj}(C)$ and consider the diagram

$$\begin{array}{ccccc}
 & & G_1(F_3(A)) & & \\
 & G_1(\alpha'_A) \nearrow & & \searrow \beta_{F_3(A)} & \\
 G_1(F_1(A)) & \xrightarrow{G_1(\alpha_A)} & G_1(F_2(A)) & (1) & G_2(F_3(A)) \xrightarrow{\beta'_{F_3(A)}} G_3(F_3(A)). \\
 & \searrow \beta_{F_2(A)} & & \nearrow G_2(\alpha'_A) & \\
 & & G_2(F_2(A)) & &
 \end{array}$$

The top composition

$$\begin{array}{ccccc}
 & & G_1(F_3(A)) & & \\
 & G_1(\alpha'_A) \nearrow & & \searrow \beta_{F_3(A)} & \\
 G_1(F_1(A)) & \xrightarrow{G_1(\alpha_A)} & G_1(F_2(A)) & (1) & G_2(F_3(A)) \xrightarrow{\beta'_{F_3(A)}} G_3(F_3(A)). \\
 & \searrow \beta_{F_2(A)} & & \nearrow G_2(\alpha'_A) & \\
 & & G_2(F_2(A)) & &
 \end{array}$$

is given by $((\beta' \circ \beta) \star (\alpha' \circ \alpha))_A$, while the bottom composition

$$\begin{array}{ccccc}
 & & G_1(F_3(A)) & & \\
 & \nearrow^{G_1(\alpha'_A)} & & \searrow_{\beta_{F_3(A)}} & \\
 G_1(F_1(A)) & \xrightarrow{G_1(\alpha_A)} & G_1(F_2(A)) & \xrightarrow{\beta_{F_2(A)}} & G_2(F_2(A)) \\
 & & \nwarrow_{\beta_{F_2(A)}} & & \nearrow^{G_2(\alpha'_A)} \\
 & & G_2(F_3(A)) & \xrightarrow{\beta'_{F_3(A)}} & G_3(F_3(A))
 \end{array} \quad (1)$$

is given by $((\beta' \star \alpha') \circ (\beta \star \alpha))_A$. Now, Subdiagram (1) corresponds to the naturality condition

$$\begin{array}{ccc}
 G_1(F_2(A)) & \xrightarrow{G_1(\alpha'_A)} & G_1(F_3(A)) \\
 \beta_{F_2(A)} \downarrow & & \downarrow \beta_{F_3(A)} \\
 G_2(F_2(A)) & \xrightarrow{G_2(\alpha'_A)} & G_2(F_3(A))
 \end{array}$$

$G_2(\alpha'_A) \circ \beta_{F_2(A)} = \beta_{F_3(A)} \circ G_1(\alpha'_A)$,

for $\beta: G_1 \Rightarrow G_2$ at $\alpha'_A: F_2(A) \rightarrow F_3(A)$, and thus commutes. Thus we have

$$((\beta' \circ \beta) \star (\alpha' \circ \alpha))_A = ((\beta' \star \alpha') \circ (\beta \star \alpha))_A$$

for each $A \in \text{Obj}(C)$ and therefore

$$(\beta' \star \alpha') \circ (\beta \star \alpha) = (\beta' \circ \beta) \star (\alpha' \circ \alpha).$$

This finishes the proof.

we have a functor

making the diagram in [Item 2](#) commute. Conversely, every such functor gives rise to a natural transformation from F to G , and these constructions are inverse to each other.

018H 8.6 Natural Isomorphisms

Let C and \mathcal{D} be categories and let $F, G: C \Rightarrow \mathcal{D}$ be functors.

018J DEFINITION 8.6.1 ► NATURAL ISOMORPHISMS

A natural transformation $\alpha: F \Rightarrow G$ is a **natural isomorphism** if there exists a natural transformation $\alpha^{-1}: G \Rightarrow F$ such that

$$\begin{aligned}
 \alpha^{-1} \circ \alpha &= \text{id}_F, \\
 \alpha \circ \alpha^{-1} &= \text{id}_G.
 \end{aligned}$$

018K PROPOSITION 8.6.2 ► PROPERTIES OF NATURAL ISOMORPHISMS

Let $\alpha: F \Rightarrow G$ be a natural transformation.

- 018L 1. *Characterisations.* The following conditions are equivalent:
- 018M (a) The natural transformation α is a natural isomorphism.

018N

(b) For each $A \in \text{Obj}(C)$, the morphism $\alpha_A: F_A \rightarrow G_A$ is an isomorphism.

018P

2. *Componentwise Inverses of Natural Transformations Assemble Into Natural Transformations.* Let $\alpha^{-1}: G \Rightarrow F$ be a transformation such that, for each $A \in \text{Obj}(C)$, we have

$$\begin{aligned}\alpha_A^{-1} \circ \alpha_A &= \text{id}_{F(A)}, \\ \alpha_A \circ \alpha_A^{-1} &= \text{id}_{G(A)}.\end{aligned}$$

Then α^{-1} is a natural transformation.

PROOF 8.6.3 ► PROOF OF PROPOSITION 8.6.2

Item 1: Characterisations

The implication **Item 1a** \Rightarrow **Item 1b** is clear, whereas the implication **Item 1b** \Rightarrow **Item 1a** follows from **Item 2**.

Item 2: Componentwise Inverses of Natural Transformations Assemble Into Na

The naturality condition for α^{-1} corresponds to the commutativity of the diagram

$$\begin{array}{ccc} G(A) & \xrightarrow{G(f)} & G(B) \\ \alpha_A^{-1} \downarrow & & \downarrow \alpha_B^{-1} \\ F(A) & \xrightarrow{F(f)} & F(B) \end{array}$$

for each $A, B \in \text{Obj}(C)$ and each $f \in \text{Hom}_C(A, B)$. Considering the diagram

$$\begin{array}{ccccc} G(A) & \xrightarrow{G(f)} & G(B) & & \\ \alpha_A^{-1} \downarrow & & \downarrow \alpha_B^{-1} & & \\ F(A) & \xrightarrow{F(f)} & F(B) & & \\ \alpha_A \downarrow & & \downarrow \alpha_B & & \\ G(A) & \xrightarrow{G(f)} & G(B), & & \end{array} \quad \begin{array}{c} (1) \\ (2) \end{array}$$

where the boundary diagram as well as Subdiagram (2) commute, we have

$$\begin{aligned} G(f) &= G(f) \circ \text{id}_{G(A)} \\ &= G(f) \circ \alpha_A \circ \alpha_A^{-1} \\ &= \alpha_B \circ F(f) \circ \alpha_A^{-1}. \end{aligned}$$

Postcomposing both sides with α_B^{-1} , we get

$$\begin{aligned} \alpha_B^{-1} \circ G(f) &= \alpha_B^{-1} \circ \alpha_B \circ F(f) \circ \alpha_A^{-1} \\ &= \text{id}_{F(B)} \circ F(f) \circ \alpha_A^{-1} \\ &= F(f) \circ \alpha_A^{-1}, \end{aligned}$$

which is the naturality condition we wanted to show. Thus α^{-1} is a natural transformation.

where $\text{id}_F: F \Rightarrow F$ is the identity natural transformation of F of [Example 8.2.4](#).

- *Composition.* For each $F, G, H \in \text{Obj}(\text{Fun}(C, \mathcal{D}))$, the composition map

$$\circ_{F,G,H}^{\text{Fun}(C,\mathcal{D})}: \text{Nat}(G, H) \times \text{Nat}(F, G) \rightarrow \text{Nat}(F, H)$$

where $\beta \circ \alpha$ is the vertical composition of α and β of [Item 1 of Proposition 8.3.3](#).
